**BIG IDEAS**

The **standard form** of a quadratic is: \( ax^2 + bx + c = 0 \).
- \( ax^2 \) is the quadratic term
- \( bx \) is the linear term
- \( c \) is the constant term

Note: If the quadratic terms is removed, the remaining terms are a linear equation.

The definition of a **quadratic equation** is: an equation of the second degree.

Multiplication Property of Zero: The **multiplication property of zero** says that if the product
of two numbers or expressions is zero, then one or both of the numbers or expressions must equal
zero. More simply, if \( x \cdot y = 0 \), then either \( x = 0 \) or \( y = 0 \), or, both \( x \) and \( y \) equal zero.

Example: The quadratic equation \((x + 2)(x - 4) = 0\) has two factors: \((x + 2)\) and \((x - 4)\). The
multiplication property of zero says that one or both of these factors must equal zero, because the
product of these two factors is zero. Therefore, write two equations, as follows:

\[
\begin{align*}
\text{Eq #1} & \quad (x + 2) = 0 \quad \text{Therefore, } x = -2 \\
\text{Eq #2} & \quad (x - 4) = 0 \quad \text{Therefore, } x = 4 \\
\end{align*}
\]

By the multiplication property of zero, \( x = \{-2, 4\} \).

Zeros: A **zero** of a quadratic equation is a **solution** or **root** of the equation. The words **zero**, **solution**, and **root** all mean the same thing. The zeros of a quadratic equation are the value(s) of \( x \) when \( y = 0 \). A quadratic equation can have one, two, or no zeros. There are four general
strategies for finding the zeros of a quadratic equation:

1) Solve the quadratic equation using the quadratic formula.
2) Solve the quadratic equation using the completing the square method.
3) Solve the quadratic equation using the factoring by grouping method.
4) Input the quadratic equation into a graphing calculator and find the x-axis intercepts.
**x-axis intercepts:** The zeros of a quadratic can be found by inspecting the graph view of the equation. In graph form, the zeros of a quadratic equation are the x-values of the coordinates of the **x-axis intercepts** of the graph of the equation. The graph of a quadratic equation is called a parabola and can intercept the x-axis in one, two, or no places.

Example: Find the x-axis intercepts of the quadratic equation \((x + 2)(x - 4) = 0\) by inspecting the x-axis intercepts of its graph.

The coordinates of the x-axis intercepts are \((-2, 0)\) and \((4, 0)\). These x-axis intercepts show that the values of \(x\) when \(y=0\) are -2 and 4, so the solutions of the quadratic equation are \(x = \{-2, 4\}\).

### The Difference Between Zeros and Factors

**Factor:** A factor is:

1) a whole number that is a divisor of another number, or
2) an algebraic expression that is a divisor of another algebraic expression.

Examples:

- 1, 2, 3, 4, 6, and 12 all divide the number 12, so 1, 2, 3, 4, 6, and 12 are all factors of 12.
- \((x - 3)\) and \((x + 2)\) will divide the trinomial expression \(x^2 - x - 6\), so \((x - 3)\) and \((x + 2)\) are both factors of the \(x^2 - x - 6\).

### Start with Factors and Find Zeros

Remember that the factors of an expression are related to the zeros of the expression by the **multiplication property of zero**. Thus, if you know the factors, it is easy to find the zeros.

Example: If the factors of the quadratic equation \(2x^2 + 5x + 6 = 0\) are \((2x + 2)\) and \((x + 3)\), then by the multiplication property of zero: either \((2x + 2) = 0\), or \((x + 3) = 0\), or both equal zero. Solving each equation for \(x\) results in the zeros of the equation, as follows:
(2x + 2) = 0  
2x = -2  
x = -1  

(x + 3) = 0  
x = -3

Start with Zeros and Find Factors

If you know the **zeros** of an expression, you can work backwards using the **multiplication property of zero** to find the **factors** of the expression. For example, if you inspect the graph of an equation and find that it has **x-intercepts** at (3,0) and (-2,0), then you know that the solutions are \( x = 3 \) and \( x = -2 \). You can use these two equations to find the factors of the quadratic expression, as follows:

\[
\begin{align*}
\quad & x = 3 \\
\quad & (x - 3) = 0 \\
\quad & x = -2 \\
\quad & (x + 2) = 0
\end{align*}
\]

The factors of a quadratic equation with zeros of 3 and -2 are \((x - 3)\) and \((x + 2)\).

With practice, you can probably move back and forth between the **zeros** of an expression and the **factors** of an expression with ease.

\[ x^2 - 2x - 4 = 0 \quad a = 1, b = -2, c = -4 \]

\[ x(2x + 3) = 12 \]
\[ 2x^2 + 6x - 12 = 0 \quad a = 2, b = 6, c = -12 \]

\[ 3x(x + 8) = -2 \]
\[ 3x^2 + 24x + 2 = 0 \quad a = 3, b = 24, c = 2 \]

\[ 5x^2 = 9 - x \]
\[ 5x^2 + x - 9 = 0 \quad a = 5, b = 1, c = -9 \]

\[ -6x^2 = -2 + x \]
\[ -6x^2 - x + 2 = 0 \quad a = -6, b = -1, c = 2 \]

\[ x^2 = 27x - 14 \]
\[ x^2 - 27x + 14 = 0 \quad a = 1, b = -27, c = 14 \]

\[ x^2 + 2x = 1 \]
\[ x^2 + 2x - 1 = 0 \quad a = 1, b = 2, c = -1 \]

\[ 4x^2 - 7x = 15 \]
\[ 4x^2 - 7x - 15 = 0 \quad a = 4, b = -7, c = -1 \]

\[ -8x^2 + 3x = -100 \]
\[ -8x^2 + 3x + 100 = 0 \quad a = -8, b = 3, c = 100 \]

\[ 25x + 6 = 99x^2 \]
\[ -99x^2 + 25x + 6 = 0 \quad a = -99, b = 25, c = 6 \]

\[ 2x^2 = 64 \]
\[ 2x^2 - 64 = 0 \quad a = 2, b = 0, c = -64 \]

\[ 0 = -16 + x^2 \]
\[ x^2 - 16 = 0 \quad a = 1, b = 0, c = -16 \]

\[ 49 = -9x^2 \]
\[ 9x^2 + 49 = 0 \quad a = 9, b = 0, c = 49 \]

\[ x^2 = 7x \]

\[ 2x^2 = -8x \]
\[ 2x^2 + 8x = 0 \quad a = 2, b = 8, c = 0 \]

\[ 0 = -9x - x^2 \]
\[ -x^2 - 9x = 0 \quad a = -1, b = -9, c = 0 \]

h. \[ -3(x - 4)(2x + 3) = 0 \] \[ x = \left\{-\frac{3}{2}, 4\right\} \]
**Part 2 – The Quadratic Formula**

The **quadratic formula** is: \( x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} \)

---

**SOLVING QUADRATIC EQUATIONS STRATEGY #1: Use the Quadratic Formula**

| Start with any quadratic equation in the form of \( ax^2 + bx + c = 0 \) | \( x^2 + 2x - 24 = 0 \)  
The right expression *must* be zero.  
| Identify the values of \( a, b, \) and \( c. \) | \( a = 1, \ b = 2, \) and \( c = -24 \) |
| Substitute the values of \( a, b, \) and \( c \) into the quadratic formula, which is \( x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} \) | \( x = \frac{-2 \pm \sqrt{(2)^2 - 4(1)(-24)c}}{2(1)} \) |
| Solve for \( x \) | \( x = \frac{-2 \pm \sqrt{100}}{2} \)  
\( x = \frac{-2 \pm 10}{2} \)  
\( x = \frac{-2 + 10}{2} \Rightarrow x = \frac{8}{2} \Rightarrow x = 4 \)  
\( x = \frac{-2 - 10}{2} \Rightarrow x = \frac{-12}{2} = -6 \) |

The quadratic formula can be used to solve any quadratic equation.

---

**Part 2 – The Quadratic Formula**

**DEVELOPING ESSENTIAL SKILLS**

Solve the following quadratic equations using the quadratic formula. Leave answers in simplest radical form.

\( x^2 - x - 3 = 0 \)

| \( x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} \)  
\( a = 1, \ b = -1, \) and \( c = -3 \) | \( x = \frac{-(-1) \pm \sqrt{(-1)^2 - 4(1)(-3)}}{2(1)} \)  
\( x = \frac{1 \pm \sqrt{1+12}}{2} \)  
\( x = \frac{1 \pm \sqrt{13}}{2} \) |
\[20x^2 - 15x - 10 = 0\]

\[x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}\]

\[a = 20, b = -15, c = -10\]

\[x = \frac{-(-15) \pm \sqrt{(-15)^2 - 4(20)(-10)}}{2(20)}\]

\[x = \frac{15 \pm \sqrt{225 + 800}}{40}\]

\[x = \frac{15 \pm \sqrt{1025}}{40}\]

\[x = \frac{15 \pm 5\sqrt{41}}{40}\]

\[x = \frac{3 \pm \sqrt{41}}{8}\]

\[2x^2 - 4x - 2 = 0\]

\[x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}\]

\[a = 2, b = -4, c = -2\]

\[x = \frac{-(-4) \pm \sqrt{(-4)^2 - 4(2)(-2)}}{2(2)}\]

\[x = \frac{4 \pm \sqrt{16 + 16}}{4}\]

\[x = \frac{4 \pm \sqrt{32}}{4}\]

\[x = \frac{4 \pm 4\sqrt{2}}{4}\]

\[x = 1 \pm \sqrt{2}\]
### $6x^2 + 11x = 35$

\[
x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}
\]

- $a = 6$, $b = 11$, $c = -35$

\[
x = \frac{-11 \pm \sqrt{(11)^2 - 4(6)(-35)}}{2(6)}
\]

\[
x = \frac{-11 \pm \sqrt{121 + 840}}{12}
\]

\[
x = \frac{-11 \pm \sqrt{961}}{12}
\]

\[
x = \frac{-11 \pm 31}{12}
\]

\[
x = \frac{20}{12} \text{ and } x = \frac{-42}{12}
\]

\[
x = \left\{ \frac{5}{3}, \frac{-7}{2} \right\}
\]

### $-7x + 12 = 4x^2$

\[
x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}
\]

- $a = -4$, $b = -7$, $c = 12$

\[
x = \frac{-(-7) \pm \sqrt{(-7)^2 - 4(-4)(12)}}{2(-4)}
\]

\[
x = \frac{7 \pm \sqrt{49 + 192}}{-8}
\]

\[

Strategy: Factor by grouping.
\[8m^2 + 20m = 12\]
\[8m^2 + 20m - 12 = 0\]
|\(\alpha x\)| = 96

The factors of 96 are:

Strategy: Transform the expression \((3x - 1)(3 - x) + 4x^2 + 15\) to a trinomial, then set the expression equal to 0 and solve it.

STEP 1. Transform \((3x - 1)(3 - x) + 4x^2 + 15\) into a trinomial.
\[ (3x - 1)(3 - x) + 4x^2 + 19 \]
